

# Scalable Automatic Machine Learning in H2O

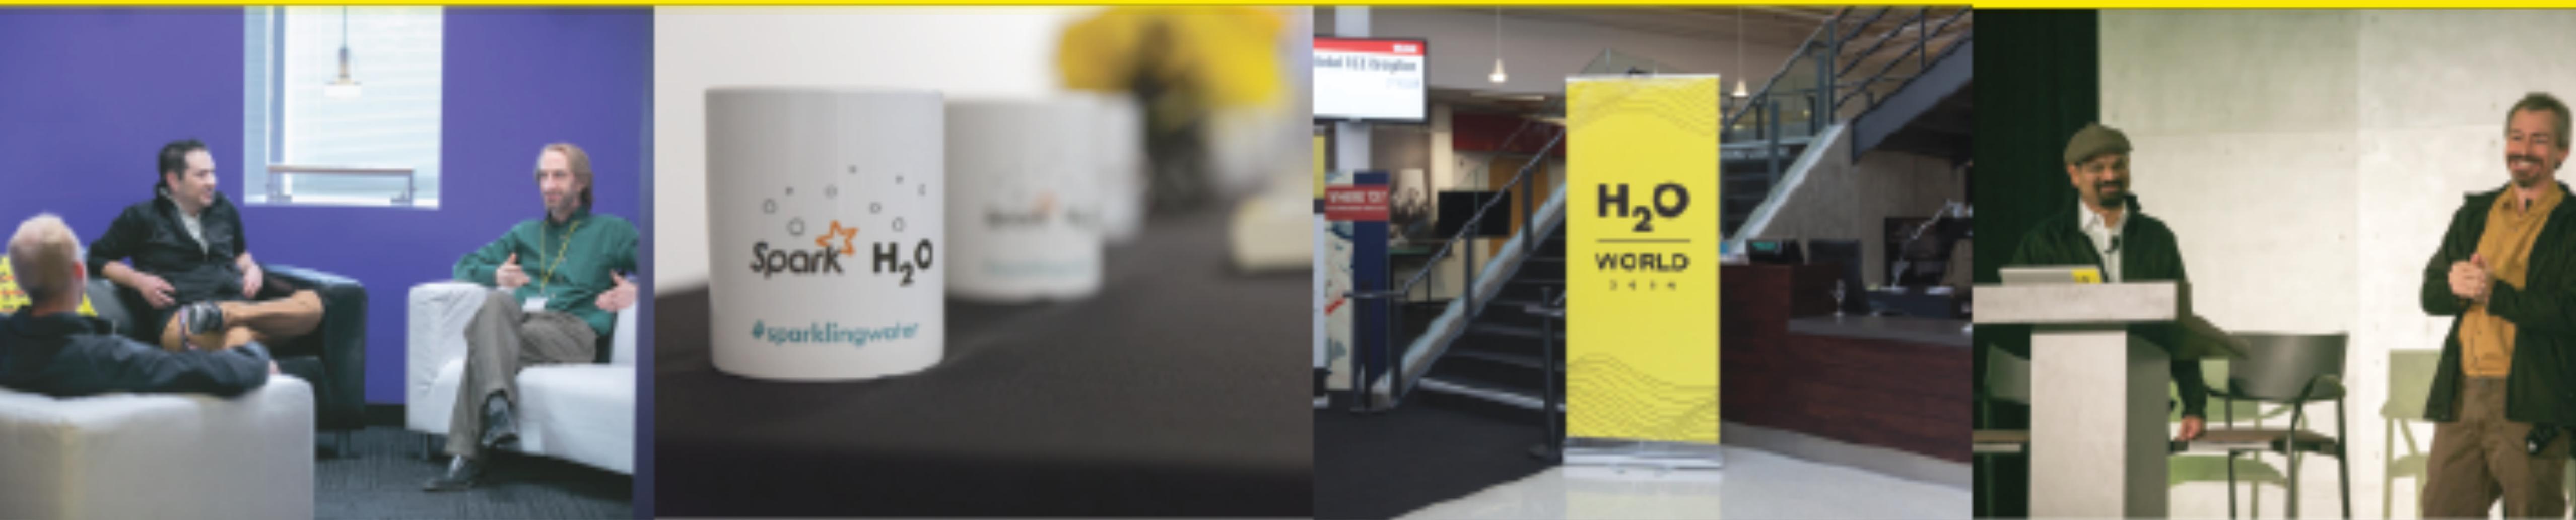

Mayo Clinic  
July 2020

Erin LeDell Ph.D.  
@ledell

# What is H2O?

H2O.ai, the company

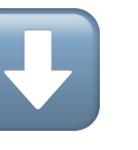

- Founded in 2012
- Advised by Stanford Professors Hastie, Tibshirani & Boyd
- Headquarters: Mountain View, California, USA

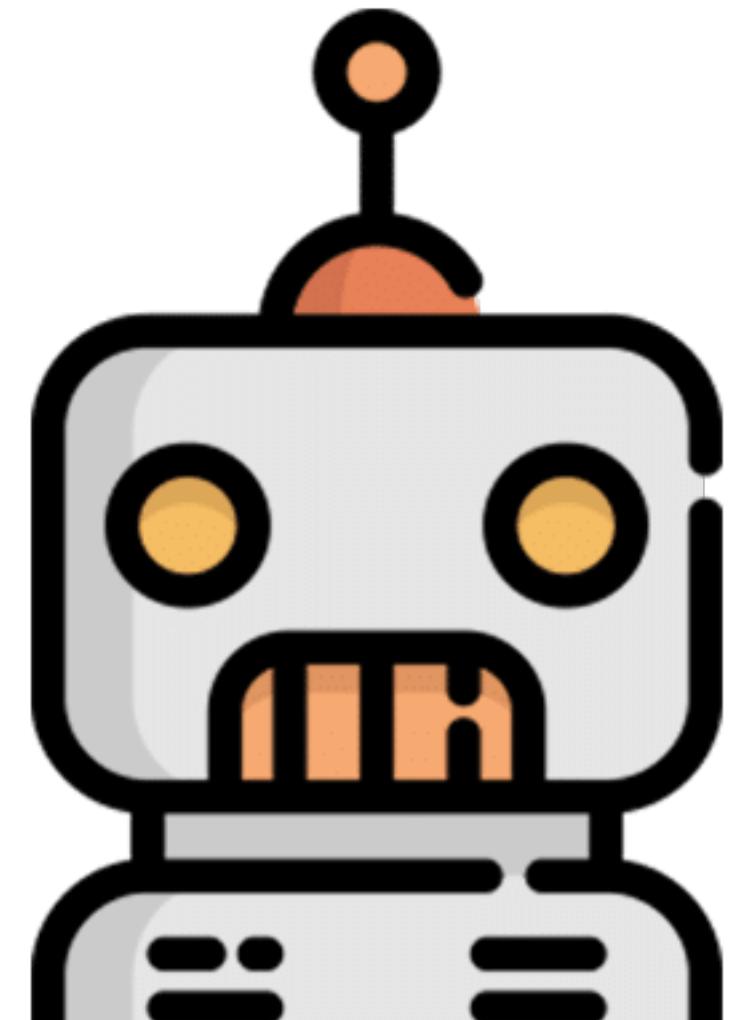

H2O, the platform

- Open Source Software (Apache 2.0 Licensed)
- R, Python, Scala, Java and Web Interfaces
- Distributed Machine Learning Algorithms for Big Data

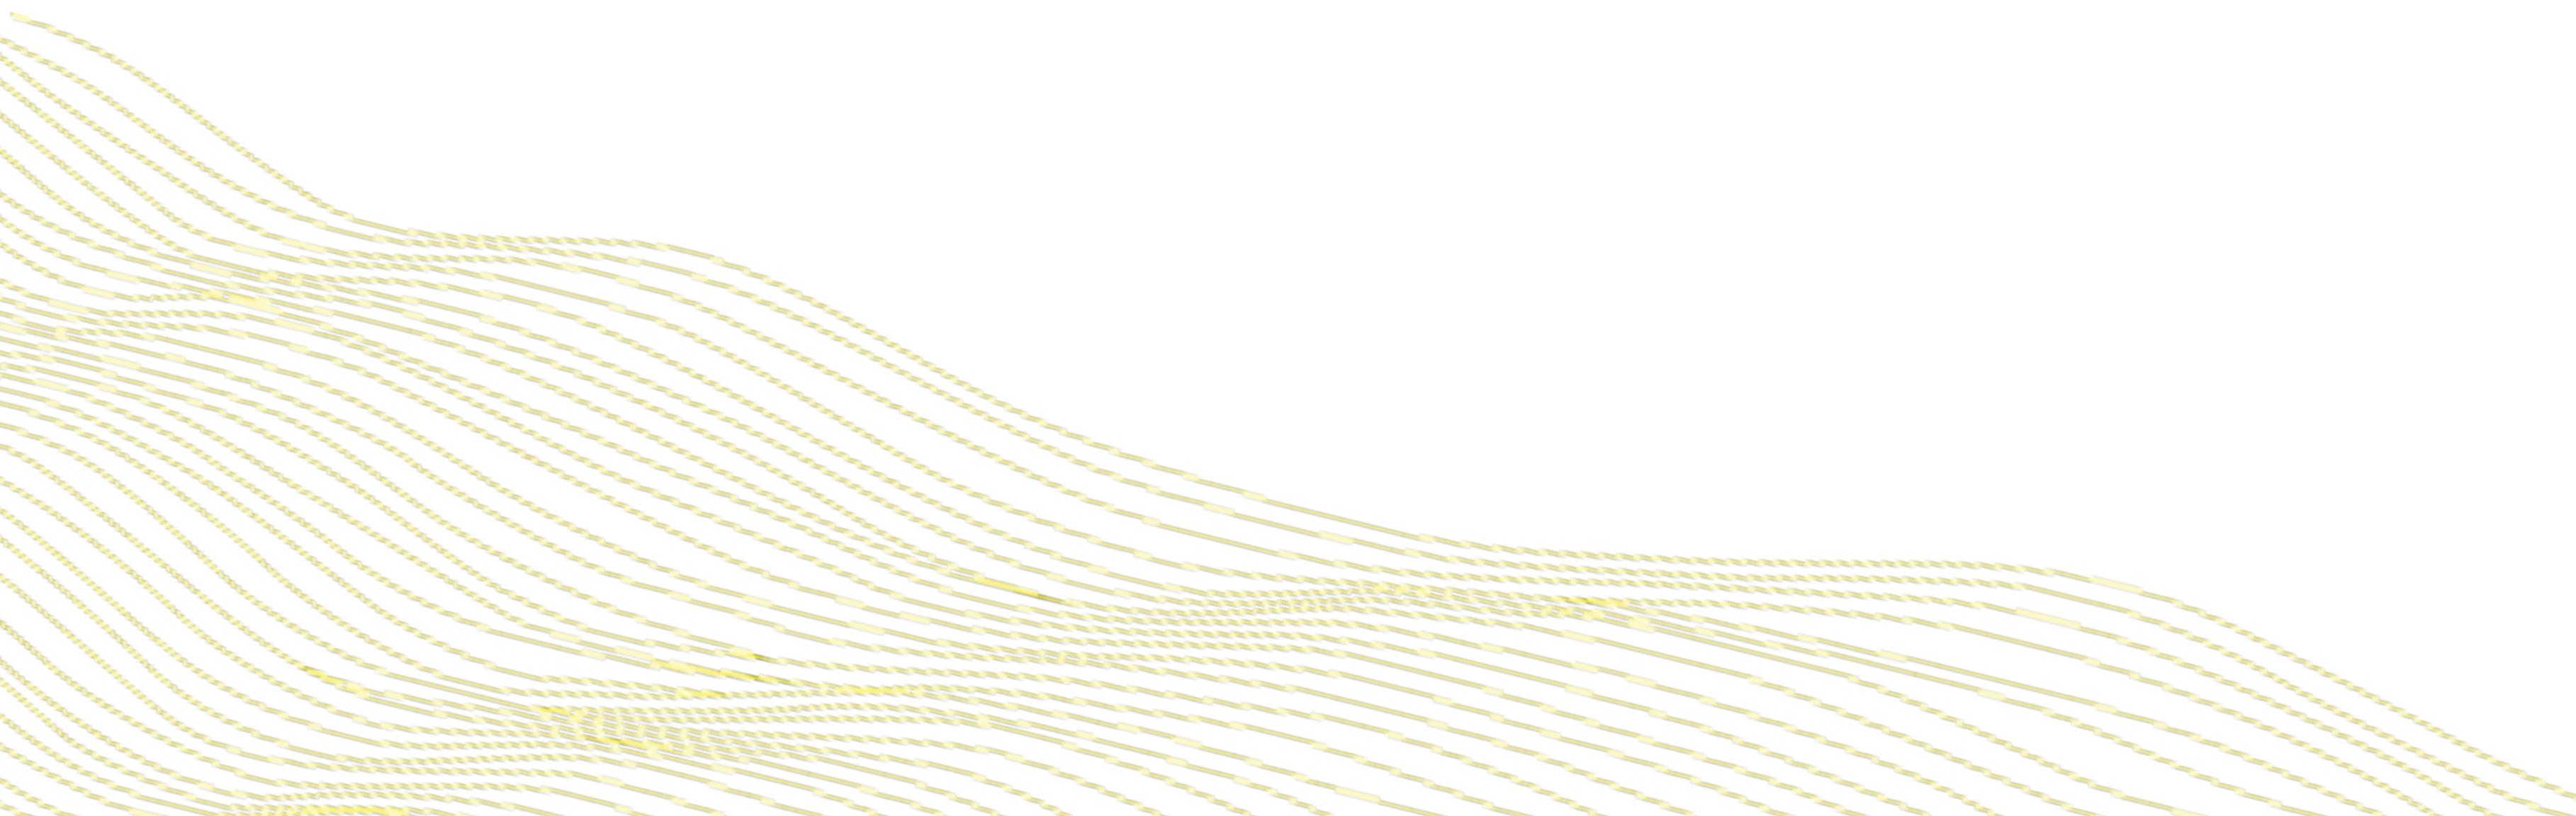

# Agenda

- H2O Platform
- Automatic Machine Learning (AutoML)
- H2O AutoML Overview
- Resources

Slides  <https://tinyurl.com/h2o-meetups>

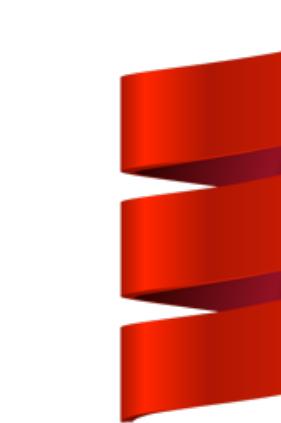

# H2O Platform

# H2O Machine Learning Platform

- Distributed (multi-core + multi-node) implementations of cutting edge ML algorithms.
- Core algorithms written in high performance Java.
- APIs available in R, Python, Scala; web GUI.
- Easily deploy models to production as pure Java code.
- Works on Hadoop, Spark, EC2, your laptop, etc.

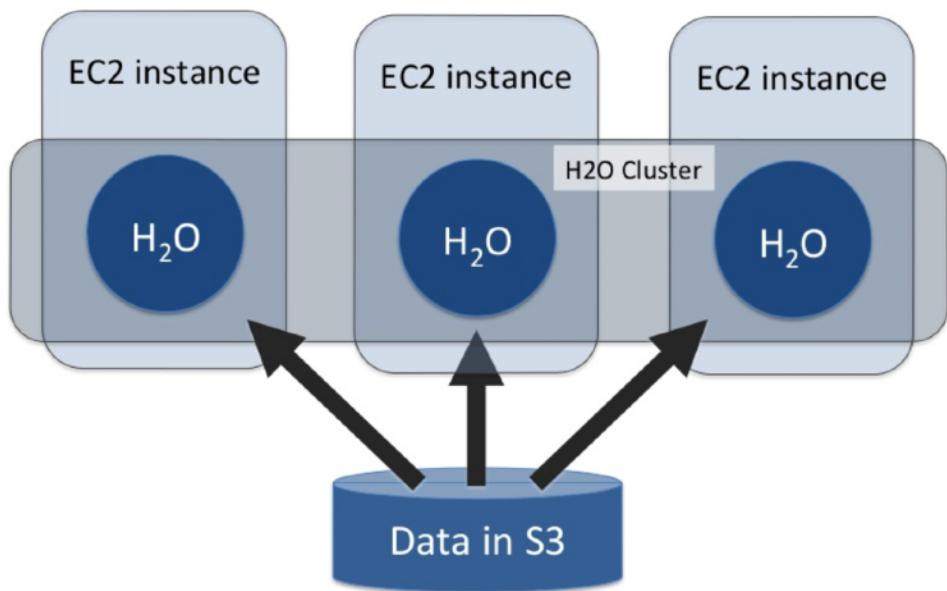

{JSON}

# H2O Distributed Computing

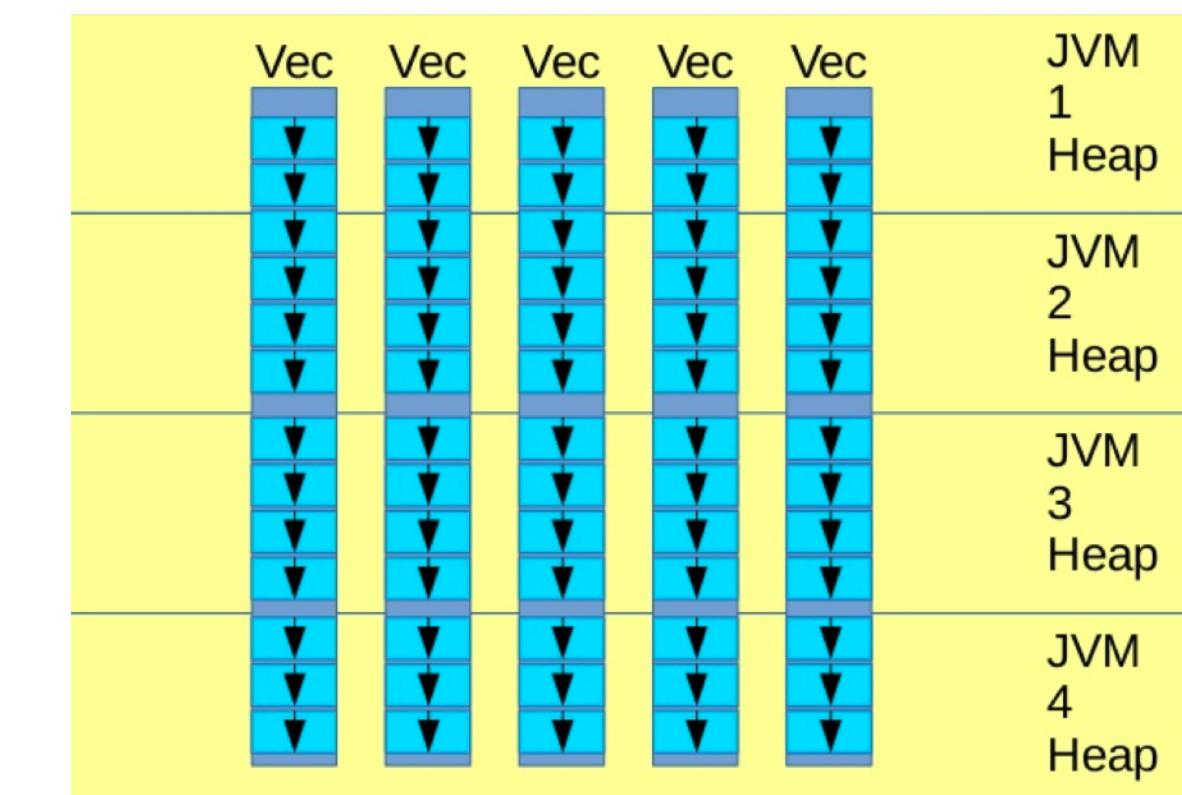

## H2O Cluster

- Multi-node cluster with shared memory model.
- All computations in memory.
- Each node sees only some rows of the data.
- No limit on cluster size.

## H2O Frame

- Distributed data frames (collection of vectors).
- Columns are distributed (across nodes) arrays.
- Works just like R's `data.frame` or Python Pandas `DataFrame`

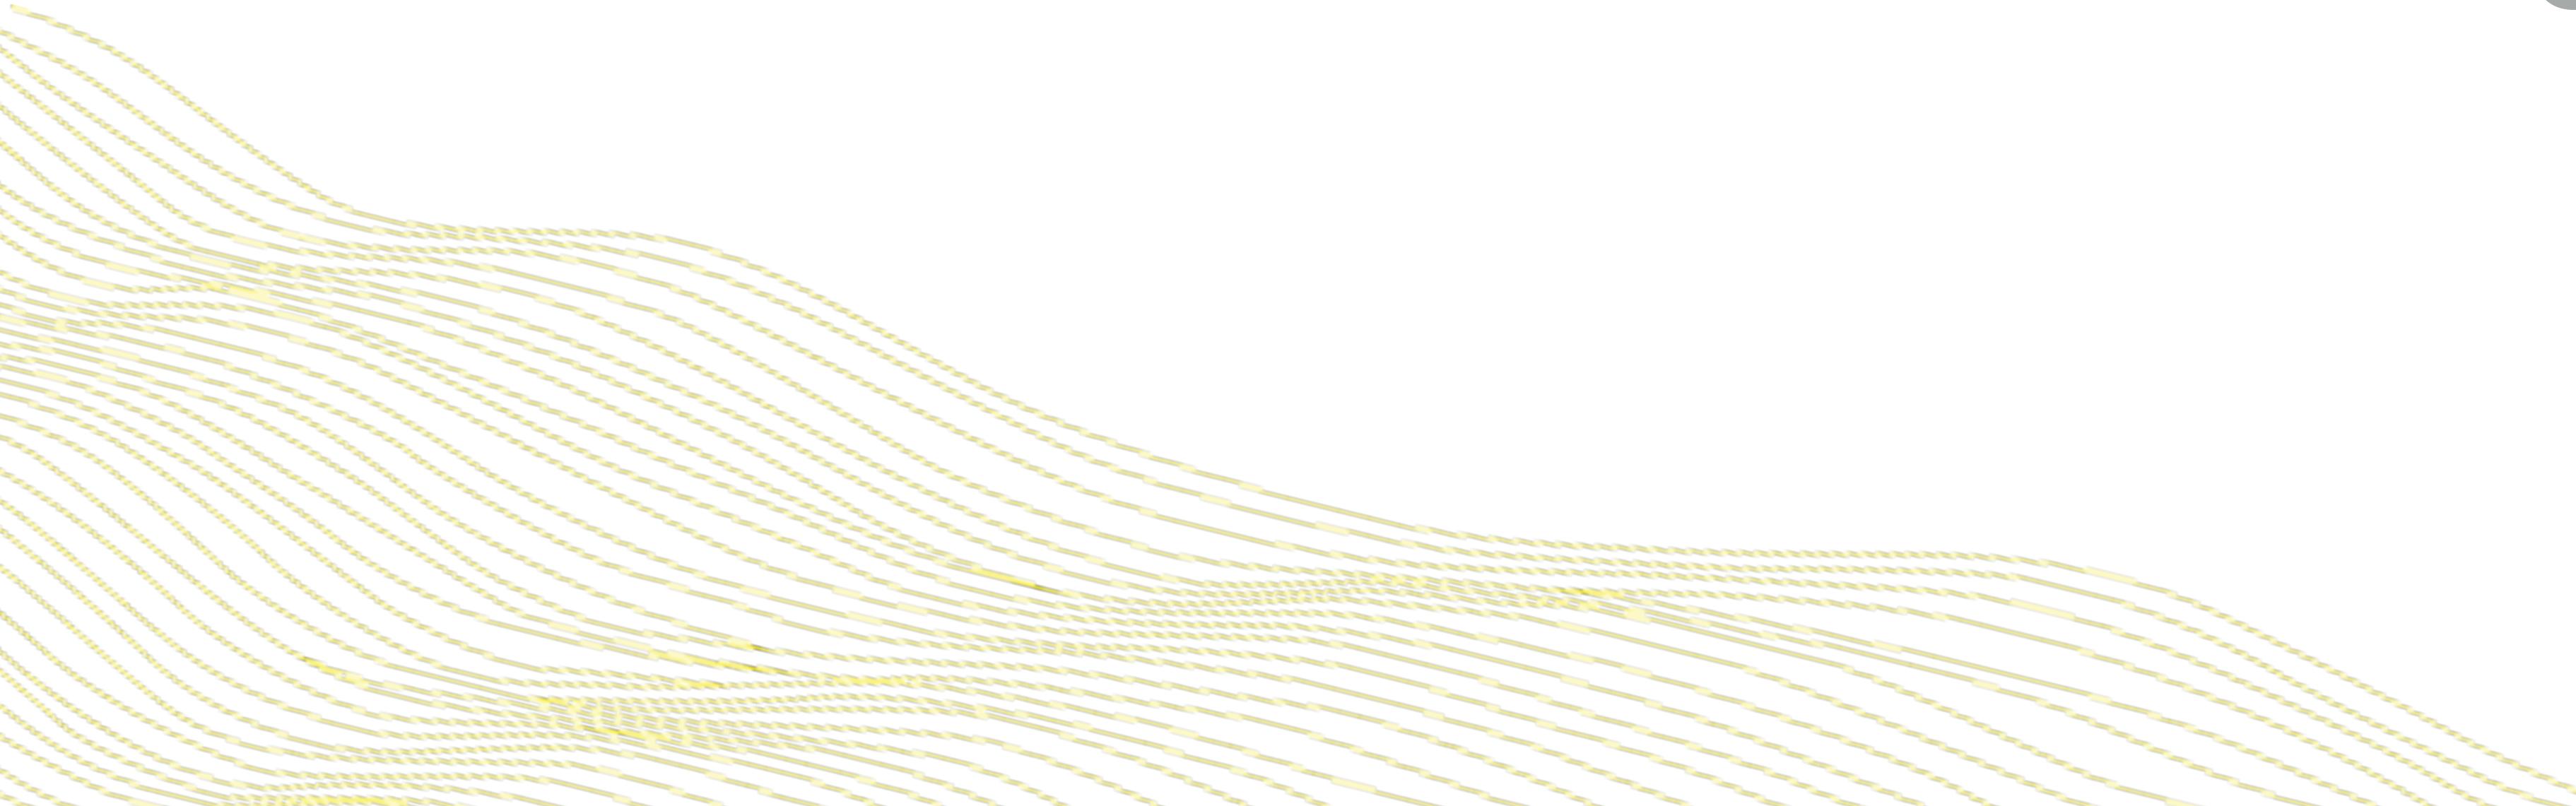

# H2O Machine Learning Features

- Supervised & unsupervised machine learning algos (GBM, RF, DNN, GLM, Stacked Ensembles, etc.)
- Imputation, normalization & auto one-hot-encoding
- Automatic early stopping
- Cross-validation, grid search & random search
- Variable importance, model evaluation metrics, plots

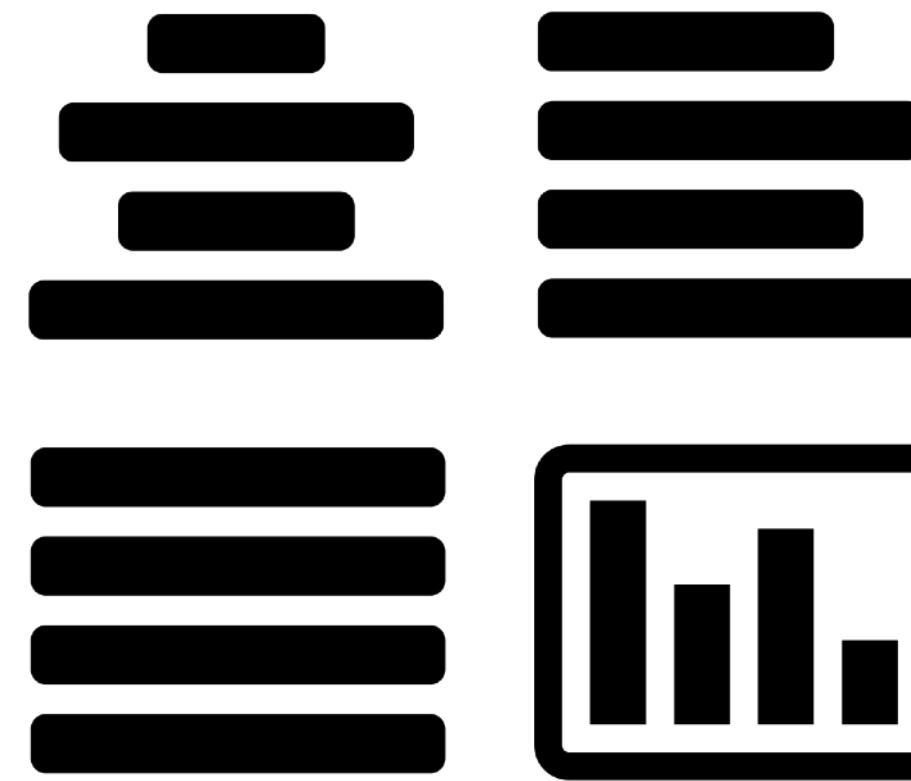

# Intro to Automatic Machine Learning

# Goals & Features of AutoML

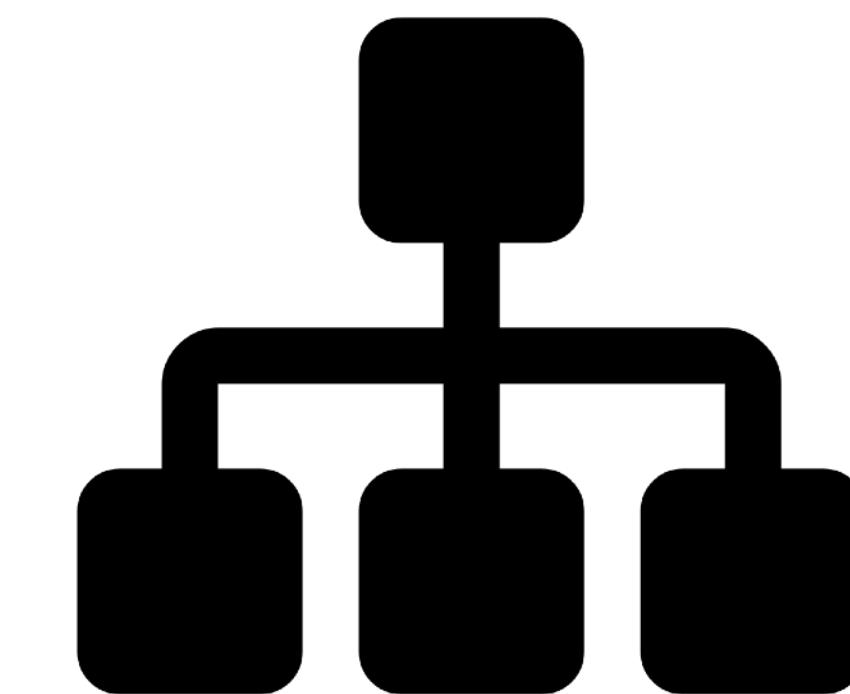

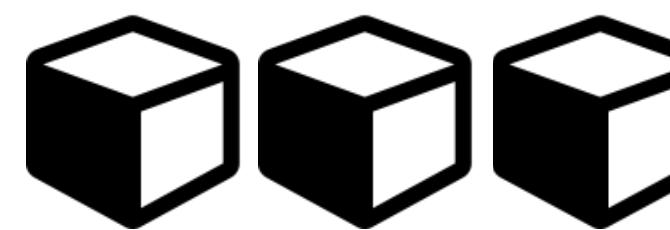

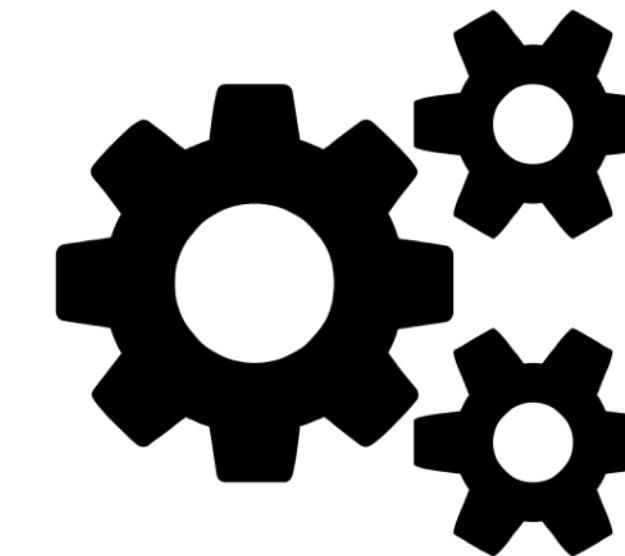

-  Train the best model in the least amount of time.
-  Reduce the human effort & expertise required in machine learning.
-  Improve the performance of machine learning models.
-  Increase reproducibility & establish a baseline for scientific research or applications.

# Aspects of Automatic Machine Learning

Data Prep

Model  
Generation

Ensembles

# Aspects of Automatic Machine Learning

## Data Preprocessing

- Imputation, one-hot encoding, standardization
  - Feature selection and/or feature extraction (e.g. PCA)
  - Count/Label/Target encoding of categorical features
- 

## Model Generation

- Cartesian grid search or random grid search
  - Bayesian Hyperparameter Optimization
  - Individual models can be tuned using a validation set
- 

## Ensembles

- Ensembles often out-perform individual models
- Stacking / Super Learning (Wolpert, Breiman)
- Ensemble Selection (Caruana)

# Different Flavors of AutoML

The screenshot shows a web browser displaying a blog post from the H2O.ai website. The URL in the address bar is <https://www.h2o.ai/blog/t>. The page title is "The different flavors of AutoML". The post is dated August 15th, 2018. The main image is a black and white photograph of four ice cream cones, each containing a different type of ice cream (vanilla, chocolate, strawberry, and mint chocolate chip). The background of the image features a network-like pattern of lines and dots.

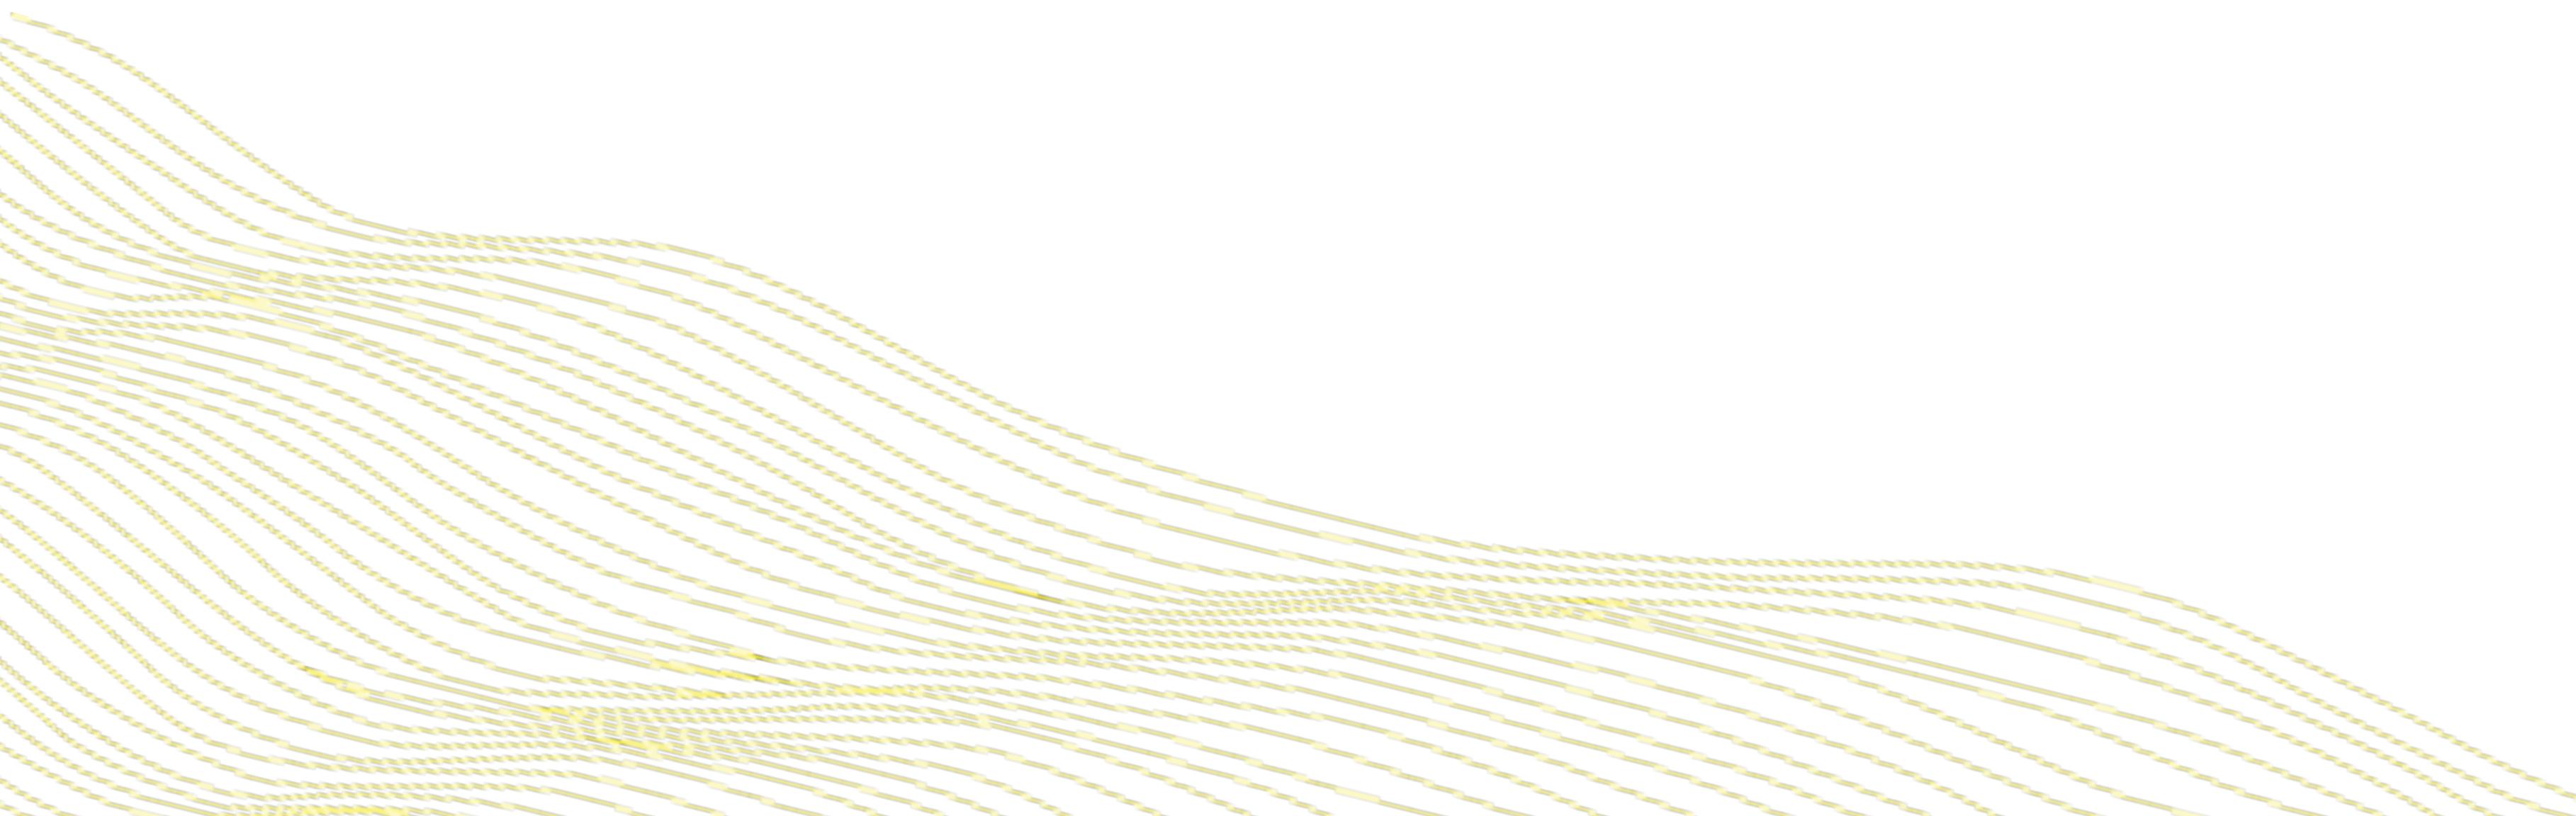

By: Erin LeDell

In recent years, the demand for machine learning experts has outpaced the supply, despite the surge of people entering the field. To address this gap, there have been big strides in the development of user-friendly machine learning software (e.g. [H2O](#), [scikit-learn](#), [keras](#)). Although these tools have made it easy to train and evaluate machine learning models, there is still a good amount of data science knowledge that's required in order to create the *highest-quality* model, given your dataset. Writing the code to perform a hyperparameter search over many different types of algorithms can also be time consuming and repetitive work.

## What is AutoML?

<https://tinyurl.com/flavors-of-automl>

# H2O's AutoML

## Data Preprocessing

- Imputation, one-hot encoding, standardization
  - Feature selection and/or feature extraction (e.g. PCA)
  - Count/Label/Target encoding of categorical features
- 

## Model Generation

- Cartesian grid search or random grid search
  - Bayesian Hyperparameter Optimization
  - Individual models can be tuned using a validation set
- 

## Ensembles

- Ensembles often out-perform individual models:
- Stacking / Super Learning (Wolpert, Breiman)
- Ensemble Selection (Caruana)

# Random Grid Search & Stacking

- Random Grid Search combined with Stacked Ensembles is a powerful combination.
- Ensembles perform particularly well if the models they are based on (1) are individually strong, and (2) make uncorrelated errors.
- Stacking uses a second-level metalearning algorithm to find the optimal combination of base learners.

# H2O AutoML

- Basic data pre-processing (as in all H2O algos).
- Trains a random grid of GBMs, DNNs, GLMs, etc. using a carefully chosen hyper-parameter space.
- Individual models are tuned using cross-validation.
- Two Stacked Ensembles are trained (“All Models” ensemble & a lightweight “Best of Family” ensemble).
- Returns a sorted “Leaderboard” of all models.
- All models can be easily exported to production.

# H2O AutoML in Python

## Example

```
import h2o  
  
from h2o.automl import H2OAutoML  
  
h2o.init()  
  
train = h2o.import_file("train.csv")  
  
aml = H2OAutoML(max_runtime_secs = 600)  
aml.train(y = "response_colname",  
          training_frame = train)  
  
lb = aml.leaderboard
```

# H2O AutoML in R

## Example

```
library(h2o)  
h2o.init()  
  
train <- h2o.importFile("train.csv")  
  
aml <- h2o.automl(y = "response_colname",  
                    training_frame = train,  
                    max_runtime_secs = 600)  
  
lb <- aml@leaderboard
```

# AutoML Pro Tips!

# AutoML Pro Tips: Exclude Algos

- If you have sparse, wide data (e.g. text), use the `exclude_algos` argument to turn off the tree-based models (GBM, RF).
- If you want tree-based algos only, turn off GLM and DNNs via `exclude_algos`.

# AutoML Pro Tips: Cluster memory

- Reminder: All H2O models are stored in H2O Cluster memory.
- Make sure to give the H2O Cluster a lot of memory if you're going to create hundreds or thousands of models.
- e.g. `h2o.init(max_mem_size = "80G")`

# AutoML Pro Tips: Add More Models

- If you want to add (train) more models to an existing AutoML project, just make sure to use the same training set and `project_name`.
- If you set the same seed twice it will give you identical models as the first run (not useful), so change the seed or leave it unset.

# H2O AutoML Roadmap

- Automatic target encoding of high cardinality categorical cols
- Model interpretability methods (TreeSHAP, PDP & ICE plots)
- Algorithmic Fairness methods (Disparate Impact Analysis)
- Better support for wide datasets via feature selection/extraction
- Support text input directly via Word2Vec
- Variable importance for Stacked Ensembles
- Improvements to the models we train based on benchmarking
- New algorithms: SVM, GAM

# H2O AutoML on Kaggle

Erin LeDell  
@ledell

I had fun playing with @h2oai #AutoML on the #KaggleDaysSF hackathon today. One line of code, 8th place!

Ran H2O AutoML for 100 mins: it trained & 5-fold CV 43 models & 2 stacked ensembles. Wish I had joined the comp earlier & run longer! 🕒

Code here: [gist.github.com/ledell/4d4cd24...](https://gist.github.com/ledell/4d4cd24...)

- On a one-day Kaggle competition, AutoML tools ruled the leaderboard.
- In regular competitions, teams have much more time to do sophisticated, hand-crafted feature engineering, and so the humans are still winning (for now... 😈).

# AutoML Benchmarks

Computer Science > Machine Learning

## An Open Source AutoML Benchmark

Pieter Gijsbers, Erin LeDell, Janek Thomas, Sébastien Poirier, Bernd Bischl, Joaquin Vanschoren

(Submitted on 1 Jul 2019)

In recent years, an active field of research has developed around automated machine learning (AutoML). Unfortunately, comparing different AutoML systems is hard and often done incorrectly. We introduce an open, ongoing, and extensible benchmark framework which follows best practices and avoids common mistakes. The framework is open-source, uses public datasets and has a website with up-to-date results. We use the framework to conduct a thorough comparison of 4 AutoML systems across 39 datasets and analyze the results.

# AutoML Benchmarks

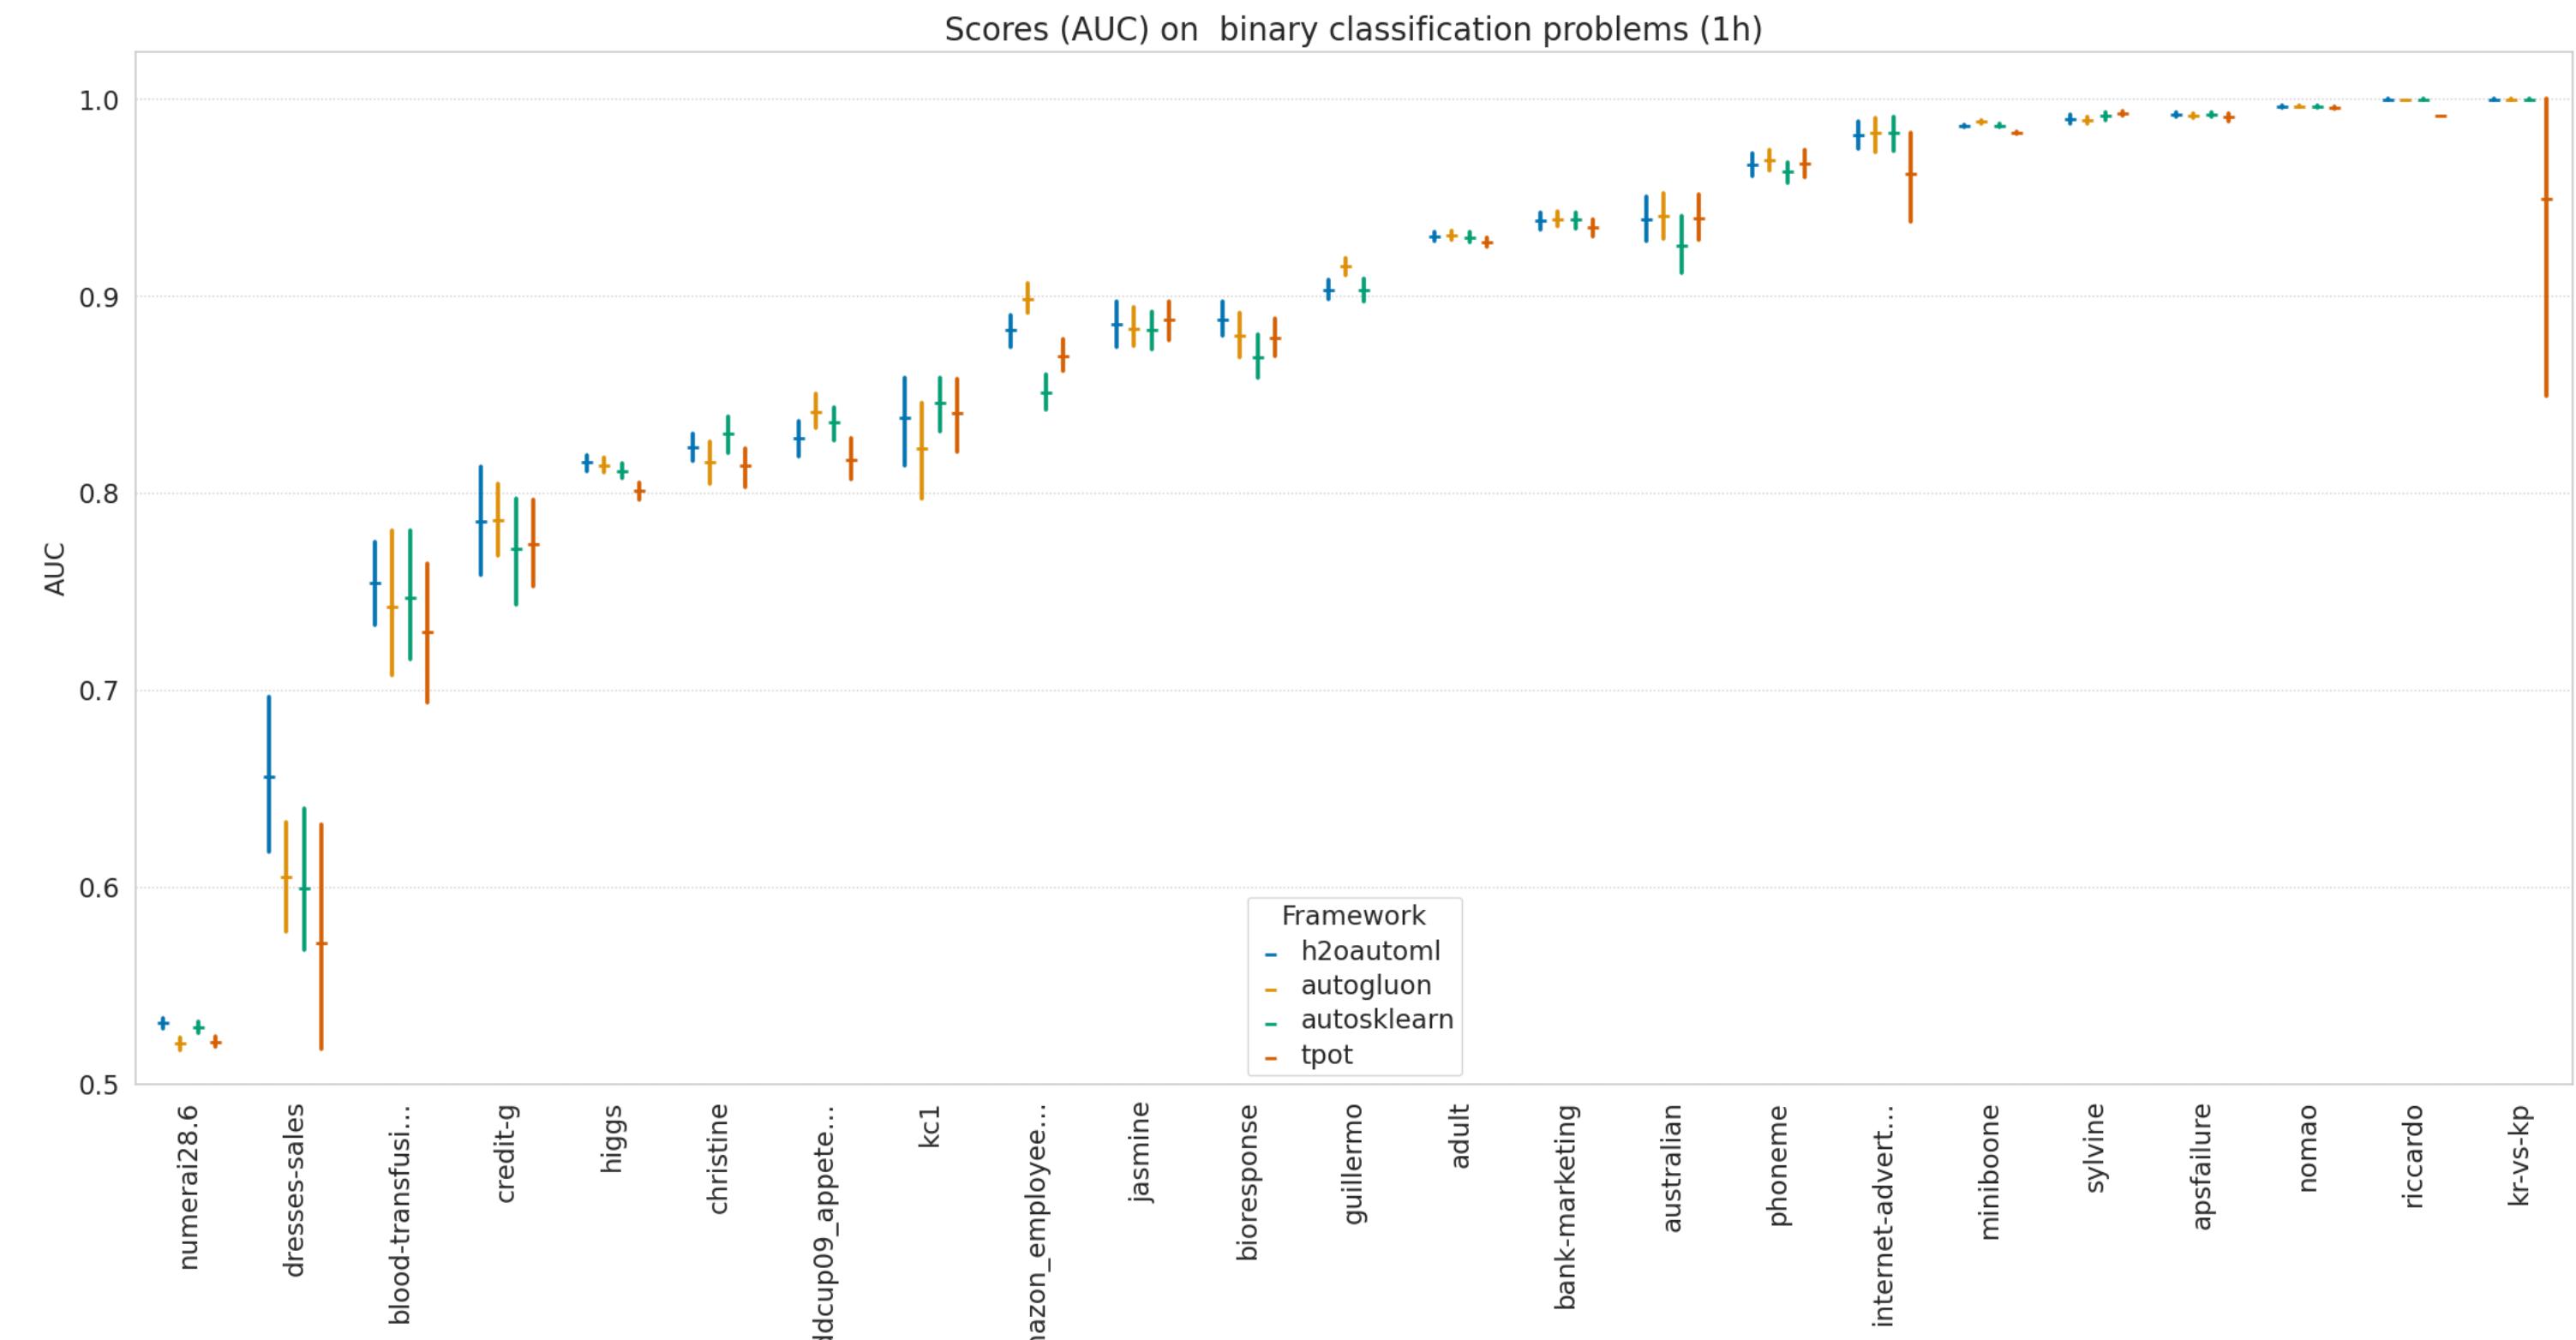

The screenshot shows a video player interface. At the top, the browser title bar reads "AutoML Systems · AutoML Bench" and "Kaggle: Your Home for Data Sci...". The URL in the address bar is "https://openml.github.io/automlbenchmark/automl\_overview.html". The video content itself is a webpage titled "AutoML Benchmark" with a dark background. On the left, there's a sidebar with links: "Results", "AutoML Systems" (which is highlighted in red), "Benchmark Datasets", "Documentation", "Paper", "About", and "Currently v0.9". Below these are icons for a refresh button, download, and RSS feed. At the bottom of this sidebar is the text "© 2019. MIT License." and a timestamp "0:03 / 1:08:28". The main content area on the right is titled "AutoML Systems" and contains text about the complexity of AutoML systems beyond just performance. It mentions various factors like API availability, programming language, stand-alone capability, model output dependency, and domain-specific development. A woman with glasses and a purple shirt is smiling and looking towards the camera. Below her is a list of AutoML systems: "auto-sklearn", "Auto-WEKA", and "H2O AutoML". The video player has standard controls at the bottom: play/pause, volume, and a progress bar showing 0:03 of 1:08:28. Below the video player, the caption reads "Kaggle Reading Group : An Open Source AutoML Benchmark | Kaggle" and "1,579 views · Streamed live on Aug 14, 2019". There are also interaction buttons for likes (76), dislikes (2), share, save, and more.
